

ABSTRACT

A combining device capable of being embedded into an object comprises: an embedding unit having a first end to be embedded into an
5 embedded object and a second end having an elastic buckling means; a hollow coupling unit having an inner surface which is formed as a channel; wherein in assembly, the second end of the embedding unit is combined with a load and then the elastic buckling means is inserted into the channel of the hollow coupling unit so that the embedding unit is tightly engaged
10 with the hollow coupling unit; and the first end is received in the embedded object so that the embedded object loading the weight of the load.
